

Chlorophyll Use in Female Seasons

I want to make breeders aware of a product that is helpful when your girls are in season. Liquid Chlorophyll - 100mg which is found in a health food store is extremely helpful in masking season and urine odors. When the girls are in season I use 1 tablespoon A.M. and P.M. feedings (poured on the girls food) and this helps to mask the odor. I have found my males will usually continue to eat even when caged in the same room when a bitch in season as long as the girls are on chlorophyll from the first day of their season.

I am not saying the dog forgets she is in season, he is just not as crazy about breeding because the chlorophyll has helped mask/absorb the odor.

Do not, I repeat, do not trust putting the animals together or you may end up with an unwanted litter and, of course, **don't use chlorophyll if you are intending to breed your bitch** as some males will refuse to breed. It may interfere with the male's interest in your girl! I have found the liquid works a little better than the capsules, just use one or the other when the girls are in season.

Also note: their stools will be **Kelly green** in color when they are on chlorophyll so **don't panic and think something is wrong.**

Chlorophyll can be purchased from health food stores or contact: World Organics Corporation, P.O. Box 8207, Fountain Valley, California 92728. The cost is approximately \$14.00 per pint which will last for more than one season.
